*How To Make Something That Makes (almost) Anything*

Active Elements  
10 minutes Summary  
2009/5/17

Taro Narahara  
Doctoral Student  
Harvard Graduate School of Design

# Precedents from Architecture:

## Construction Automation in 80's

Shiokawa, Takashi. et al. (2000) **Automated construction system for high-rise reinforced concrete buildings**, Automation in Construction 9\_2000.

## Metabolists Movements in 60s

Re-configurability

Nakagin Capsule Tower, Kurokawa, Tokyo, 1971.  
The Cluster in the air, Isozaki, 1962.

Allow 90degree Rotations

I am interested in reconfigurable units that can move based on locally defined rules rather than imposing top-down instructions. Each unit has its own feedback system.

## Rules produce Non-Deterministic Structures

populations of rules

### Locally defined Rules

## Distributed System:

## System (Virtual Machine)

- Reconstruct **global topology** from local connectivity information from each component using Internet-0.
- Mental Picture inside the VM

## Physical Machine

Physical

- Reconstruct Configuration
- Simulate Movements in VM
- Send Instructions to Robots

[http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/assignment\\_2.wmv](http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/assignment_2.wmv)

Physical

Feedback

- Send Instructions to Robots
- Move Robots
- Measure Performance  
(Distance moved, Amount of Solar-exposure, etc.)

## 2-DOF at the JOINT

4 possible orientations per a joint

# User Interface design, Control, & Synchronization

[http://fab.cba.mit.edu/classes/MIT/961.09/projects/active\\_elements/PS7\\_Taro.MOV](http://fab.cba.mit.edu/classes/MIT/961.09/projects/active_elements/PS7_Taro.MOV)

[http://fab.cba.mit.edu/classes/MIT/961.09/projects/active\\_elements/PS9\\_Taro.mov](http://fab.cba.mit.edu/classes/MIT/961.09/projects/active_elements/PS9_Taro.mov)

# ALA: Serial / Parallel Converter

## Implementation Example:

Timing ID rotation  
[ 0..10 1..10 0..11] ... [ 1..11 1..00 0..10] ...

00 := 0 degree

01 := 120 degree

10 := -120 degree

:

:

Serial Inputs

variable length control generator

# Serial / Parallel Converter

Outputs

1 0 0.

0 0 0

1 1 1

0 1 0

1 0 0

[http://fab.cba.mit.edu/classes/MIT/961.09/projects/active\\_elements/BS10\\_ALATaro.gif](http://fab.cba.mit.edu/classes/MIT/961.09/projects/active_elements/BS10_ALATaro.gif)

1 0 0. 0 0 0. 1 1 1. 0 1 0. 1 0 0. Inputs

## Pre-defined goal configuration

## Unknown goal configuration (based on local sensing)

Optimize Rotations of

**6 Motors**

Based on Values from

**4 light Sensors**

# Multi-dimensional Optimization: Nelder-Mead Method (amoeba)

6 dimensional space  $\rightarrow$  find optimal lighting condition from average of 4 sensor (light diodes) values  
optimize  $F(\sum \text{sensor}_i / n)$

$F(B) < F(G) < F(W)$  (Initial triangle)

$R = (M - W) + M$

If  $F(R) < F(G)$

If  $F(B) < F(R)$  Then  $W \rightarrow R$

Else

$E = (R - M) + R$

If  $F(E) < F(B)$  Then  $W \rightarrow E$

Else  $W \rightarrow R$

Else

If  $F(R) < F(W)$  Then  $W \rightarrow R$

$C = (M + R) / 2$

If  $F(C) < F(W)$  Then  $W \rightarrow C$

Else

$S = (B + M) / 2$   $W \rightarrow S$

# Multi-dimensional Optimization:

Best: Servo1: 110°  
Servo2: 110°  
Servo3: 135°  
Servo4: 45°  
Servo5: 45°  
Servo6: 110°

Ameoba walk process

Example:  $f(x, y) = x^2 - 4x + y^2 - y - xy$

Worst: Servo1: 90°  
Servo2: 110°  
Servo3: 90°  
Servo4: 90°  
Servo5: 110°  
Servo6: 140°

Good: Servo1: 45°  
Servo2: 130°  
Servo3: 180°  
Servo4: 75°  
Servo5: 95°  
Servo6: 25°

[http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/11\\_Taro\\_0.mov](http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/11_Taro_0.mov)

## Random Search Example

Foreach sensors

    If (Sensor value improved)

        Then continue to rotate in the same direction

    Else Turn the other way

|         |          |          |         |
|---------|----------|----------|---------|
| Sensor1 | Sensor2  | Sensor3  | Sensor4 |
| Motor1  | Motor2,3 | Motor4,5 | Motor6  |

[http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/11\\_Taro1b\\_Li.mov](http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/11_Taro1b_Li.mov)

[http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/11\\_Taro\\_2\\_Li.mov](http://fab.cba.mit.edu/classes/MIT/961.09/people/Taro/11_Taro_2_Li.mov)

## Nelder-Mead Method Implementation

## Possible Future Explorations:

- Look at other multidimensional optimization algorithms: Levenberg-Marguardt, and etc.
- Further investigations on appropriate Geometries of elements for architectural and spatial purposes. (I only used simple square for my own experiments)
- Use architectural program types, occupancies, or social issues as a feedback values to optimize configurations. (not only environmental such as light value)
